Assessment: Appendix

Criterion A – Appendix:

Appendix A-1: Quote from Initial Client Interview

What do you think about CodingBat as an educational platform? What aspects of CodingBat would you like to see improved in a new system?

Mr. Brown: “While CodingBat is a useful resource that I had continuously used with my students, I would really like a personalized system where I’m able to customize my own questions, have a built-in algorithm that recommends questions based on the student’s past successes and failures, and have a hint box that doesn’t show the hint immediately once clicked like CodingBat. I would also like a more aesthetically pleasing GUI with a calming color”

Criterion B – Appendix:

I'm unsure what the criteria for your Computer Sci IA requires you to do. The help learning support would like requires creating some basic formulas and displaying their results. Is that something that can fulfill your IA requirement? Please let me know.

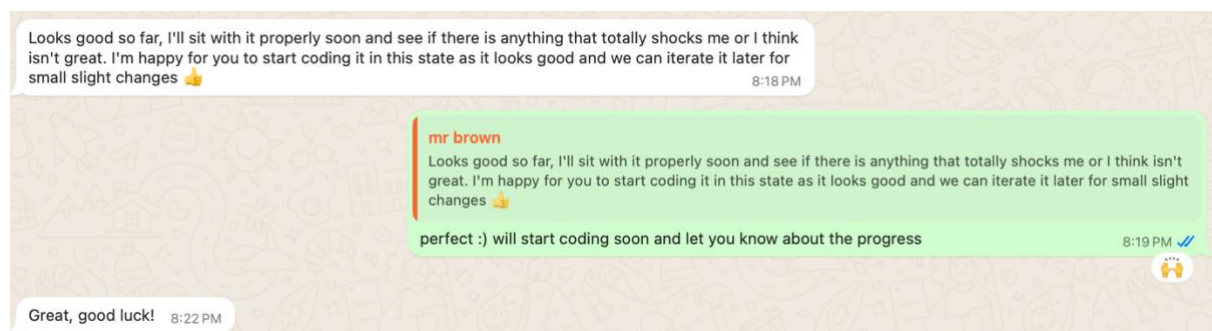

Example Problem:

A student has a test in a class. The test is 40min/55 min/ or 80 minutes long. The student has 10/25/33/or 50% additional time. If the test begins at 9:30... what will the finishing time be?

Learning support is currently collecting and monitoring all of this data. However, all calculations are done individually... we have not come up with a formula to help generate/predict ending times of future tests. It is very time consuming. Learning support would rather spend the time working with students than calculate finishing times for test accommodations.

It would be really helpful if something could be created where learning support would only input certain variables (the start time of the test, the length of time of the test, the percentage of additional time the student needs, when the test starts) to figure out the finishing time of the test.

Appendix B-2: Text Message Feedback from Client (Mr.Brown) regarding GUI Prototype Design

Appendix B-3: Transcription of Conversation with Client regarding Feedback of Completed Code

Progress Bar Feedback:

Mr. Brown: “I noticed the progress bar when it’s 100% is very hard to read the number, because it goes dark purple and it’s dark writing. So, maybe it doesn’t even need a percentage sign, even just the bar on its own is enough for me to see it. And maybe instead of it being purple, changing it to a green bar would be better”

“Back” and “Continue/Moving Forward” Buttons Feedback:

Mr. Brown: “It would be nice if all the “back” buttons were like a slight shade of red just so that it stands out where I’m like, okay, don’t accidentally click that. Or if you are encouraging me to save something or continue/move forward, make it green.”

Criterion E – Appendix:

Appendix E-1: Transcription of Client Quotes from Final Client-Programmer Meeting

Mr. Brown: “Honestly, after going through the program features everything seems really good and does what I asked, no comment on that. The only thing I’m requesting to change the progress sign, progress bar color, and just altering the ‘back’ and ‘forward’ buttons to red and green, which is just small alterations. Otherwise, I’m really happy with this program.”
